

Hadoop – The Definitive Guide

Chapters 13, 14 & 15: HBase, ZooKeeper, and Sqoop

Chapters 13, 14 & 15

HBase, ZooKeeper, and Sqoop

Hadoop – The Definitive Guide

Chapters 13, 14 & 15: HBase, ZooKeeper, and Sqoop

Learning Objectives

- Introduce HBase
- Introduce ZooKeeper
- Introduce Sqoop

Hadoop – The Definitive Guide

Chapters 13, 14 & 15: HBase, ZooKeeper, and Sqoop

What Is HBase

- HBase is a distributed column-oriented database built on top of HDFS.
- HBase is used for real-time read/write random access to very large datasets.
- HBase is not relational and does not support SQL.
- Hbase can do what an RDBMS cannot: host very large, sparsely populated tables on clusters.

Hadoop – The Definitive Guide

Chapters 13, 14 & 15: HBase, ZooKeeper, and Sqoop

Column Family

- Row columns are grouped into column families and all column family members have a common prefix.
- The columns `temperature:air` and `temperature:dew_point` are both members of the `temperature` column family.
- Whereas `station:identifier` belongs to the `station` family.
- The column family prefix must be composed of printable characters. The qualifying tail and the column family qualifier can be made of any arbitrary bytes.

Hadoop – The Definitive Guide

Chapters 13, 14 & 15: HBase, ZooKeeper, and Sqoop

Regions

- Tables are automatically partitioned horizontally by HBase into regions.
- Each region comprises a subset of a table's rows.
- A region is denoted by the table it belongs to, its first row, inclusive, and last row, exclusive.
- Initially, a table comprises a single region, but as the size of the region grows, after it crosses a configurable size threshold, it splits at a row boundary into two new regions of approximately equal size.
- Until this first split happens, all loading will be against the single server hosting the original region.

Hadoop – The Definitive Guide

Chapters 13, 14 & 15: HBase, ZooKeeper, and Sqoop

Hbase Configuration

- HBase includes an HBase *master* node and a cluster of one or more *regionserver* slaves.
- The HBase master is responsible for bootstrapping a virgin install, for assigning regions to registered regionserver, and for recovering regionserver failures.
- The regionserver carry zero or more regions and field client read/write requests.
- The regionserver also manage region splits, informing the HBase master about the new daughter regions.

Hadoop – The Definitive Guide

Chapters 13, 14 & 15: HBase, ZooKeeper, and Sqoop

Hbase Cluster Members

Hadoop – The Definitive Guide

Chapters 13, 14 & 15: HBase, ZooKeeper, and Sqoop

Hbase Needs ZooKeeper

- HBase depends on ZooKeeper (Chapter 14), and by default it manages a ZooKeeper instance as the authority on cluster state.
- HBase hosts vitals such as the location of the root catalog table and the address of the current cluster master.
- Assignment of regions is mediated via ZooKeeper in case participating servers crash mid-assignment.
- Hosting the assignment transaction state in ZooKeeper makes it so recovery can pick up on the assignment where the crashed server left off.

Hadoop – The Definitive Guide

Chapters 13, 14 & 15: HBase, ZooKeeper, and Sqoop

Hbase Example – 1

Row Key	Customer		Sales	
Customer Id	Name	City	Product	Amount
101	John White	Los Angeles, CA	Chairs	\$400.00
102	Jane Brown	Atlanta, GA	Lamps	\$200.00
103	Bill Green	Pittsburgh, PA	Desk	\$500.00
104	Jack Black	St. Louis, MO	Bed	\$1600.00

Column Families

Hadoop – The Definitive Guide

Chapters 13, 14 & 15: HBase, ZooKeeper, and Sqoop

Hbase Example – 2

```
hbase(main):010:0> scan 'emp'
```

ROW

COLUMN + CELL

```
1 column = personal data:city, timestamp = 1417521848375, value = hyderabad
```

```
1 column = personal data:name, timestamp = 1417521785385, value = ramu
```

```
1 column = professional data:designation, timestamp = 1417585277, value = manager
```

```
1 column = professional data:salary, timestamp = 1417521903862, value = 50000
```

```
1 row(s) in 0.0370 seconds
```

Hadoop – The Definitive Guide

Chapters 13, 14 & 15: HBase, ZooKeeper, and Sqoop

Launch Hbase

To administer your HBase instance, launch the HBase shell by typing:

```
% hbase shell
```

```
HBase Shell; enter 'help<RETURN>' for list of supported commands.
```

```
Type "exit<RETURN>" to leave the HBase Shell
```

```
Version: 0.89.0-SNAPSHOT, ra4ea1a9a7b074a2e5b7b24f761302d4ea28ed1b2, Sun Jul 18
```

```
15:01:50 PDT 2010 hbase(main):001:0>
```

To create a table named `test` with a single column family named `data` using defaults for table and column family attributes, enter:

```
hbase(main):007:0> create 'test', 'data'
```

```
0 row(s) in 1.3066 seconds
```

Hadoop – The Definitive Guide

Chapters 13, 14 & 15: HBase, ZooKeeper, and Sqoop

Insert and List Data

To prove the new table was created successfully, run the `list` command. This will output all tables in user space:

```
hbase(main):019:0> list
test
1 row(s) in 0.1485 seconds
```

To insert data into three different rows and columns in the data column family, and then list the table content, do the following:

```
hbase(main):021:0> put 'test', 'row1', 'data:1', 'value1'
0 row(s) in 0.0454 seconds
hbase(main):022:0> put 'test', 'row2', 'data:2', 'value2'
0 row(s) in 0.0035 seconds
hbase(main):023:0> put 'test', 'row3', 'data:3', 'value3'
0 row(s) in 0.0090 seconds
hbase(main):024:0> scan 'test'
ROW                                COLUMN+CELL
row1                               column=data:1, timestamp=1240148026198, value=value1
row2                               column=data:2, timestamp=1240148040035, value=value2
row3                               column=data:3, timestamp=1240148047497, value=value3
3 row(s) in 0.0825 seconds
```

Hadoop – The Definitive Guide

Chapters 13, 14 & 15: HBase, ZooKeeper, and Sqoop

More Hbase Commands

To remove the table, you must first disable it before dropping it:

```
hbase(main):025:0> disable 'test'  
09/04/19 06:40:13 INFO client.HBaseAdmin: Disabled test  
0 row(s) in 6.0426 seconds  
hbase(main):026:0> drop 'test'  
09/04/19 06:40:17 INFO client.HBaseAdmin: Deleted test  
0 row(s) in 0.0210 seconds  
hbase(main):027:0> list  
0 row(s) in 2.0645 seconds
```

Shut down your HBase instance by running:

```
% stop-hbase.sh
```

Hadoop – The Definitive Guide

Chapters 13, 14 & 15: HBase, ZooKeeper, and Sqoop

What Is ZooKeeper

- ZooKeeper is a centralized service for maintaining configuration information, naming, providing distributed synchronization, and providing group services.
- ZooKeeper provides users a set of tools to build distributed applications that can safely handle partial failures.
- ZooKeeper has a rich set of building blocks that can be used to build a large class of coordination data structures and protocols. Examples include: distributed queues, distributed locks, and leader election among a group of peers.

Hadoop – The Definitive Guide

Chapters 13, 14 & 15: HBase, ZooKeeper, and Sqoop

Start ZooKeeper

With a suitable configuration defined, we are now ready to start a local ZooKeeper server:

```
% zkServer.sh start
```

To check whether ZooKeeper is running, send the ruok command (“Are you OK?”) to the client port using nc (telnet works, too):

```
% echo ruok | nc localhost 2181  
imok
```

Hadoop – The Definitive Guide

Chapters 13, 14 & 15: HBase, ZooKeeper, and Sqoop

Znodes – 1

- One way of understanding ZooKeeper is to think of it as providing a high-availability filesystem.
- It doesn't have files and directories, but a unified concept of a node, called a znode.
- Znode acts both as a container of data (like a file) and a container of other znodes (like a directory).

Hadoop – The Definitive Guide

Chapters 13, 14 & 15: HBase, ZooKeeper, and Sqoop

Znodes – 2

Hadoop – The Definitive Guide

Chapters 13, 14 & 15: HBase, ZooKeeper, and Sqoop

ZooKeeper Application Examples

- Create a ZooKeeper group – p. 493
- Join a ZooKeeper group – p. 495
- List members in a group – p. 496
- Delete a ZooKeeper group – p. 498

Hadoop – The Definitive Guide

Chapters 13, 14 & 15: HBase, ZooKeeper, and Sqoop

What Is Sqoop

- Sqoop is an open source tool that allows users to extract data from a structured data store into Hadoop for further processing.
- It's even possible to use Sqoop to move data from a database into HBase.
- When the final results of an analytic pipeline are available, Sqoop can export these results back to the data store for consumption by other clients.

Hadoop – The Definitive Guide

Chapters 13, 14 & 15: HBase, ZooKeeper, and Sqoop

Sqoop Commands

```
% sqoop help
```

```
usage: sqoop COMMAND [ARGS]
```

Available commands:

codegen	Generate code to interact with database records
create-hive-table	Import a table definition into Hive
eval	Evaluate a SQL statement and display the results
export	Export an HDFS directory to a database table
help	List available commands
import	Import a table from a database to HDFS
import-all-tables	Import tables from a database to HDFS
job	Work with saved jobs
list-databases	List available databases on a server
list-tables	List available tables in a database
merge	Merge results of incremental imports
metastore	Run a standalone Sqoop metastore
version	Display version information

Hadoop – The Definitive Guide

Chapters 13, 14 & 15: HBase, ZooKeeper, and Sqoop

A Sqoop Example – 1

Example 15-2. Populating the database

```
% mysql hadoopguide
```

```
Welcome to the MySQL monitor.  Commands end with ; or \g.
```

```
Your MySQL connection id is 352
```

```
Server version: 5.1.37-1ubuntu5.4 (Ubuntu)
```

```
Type 'help;' or '\h' for help. Type '\c' to clear the current input statement.
```

```
mysql> CREATE TABLE widgets(id INT NOT NULL PRIMARY KEY AUTO_INCREMENT,  
-> widget_name VARCHAR(64) NOT NULL,  
-> price DECIMAL(10,2),  
-> design_date DATE,  
-> version INT,  
-> design_comment VARCHAR(100));
```

```
Query OK, 0 rows affected (0.00 sec)
```

Hadoop – The Definitive Guide

Chapters 13, 14 & 15: HBase, ZooKeeper, and Sqoop

A Sqoop Example – 2

```
mysql> INSERT INTO widgets VALUES (NULL, 'sprocket', 0.25, '2010-02-10',  
-> 1, 'Connects two gizmos');  
Query OK, 1 row affected (0.00 sec)
```

```
mysql> INSERT INTO widgets VALUES (NULL, 'gizmo', 4.00, '2009-11-30', 4,  
-> NULL);  
Query OK, 1 row affected (0.00 sec)
```

```
mysql> INSERT INTO widgets VALUES (NULL, 'gadget', 99.99, '1983-08-13',  
-> 13, 'Our flagship product');  
Query OK, 1 row affected (0.00 sec)
```

```
mysql> quit;
```

Hadoop – The Definitive Guide

Chapters 13, 14 & 15: HBase, ZooKeeper, and Sqoop

A Sqoop Example – 3

Now let's use Sqoop to import this table into HDFS:

```
% sqoop import --connect jdbc:mysql://localhost/hadoopguide \  
> --table widgets -m 1  
10/06/23 14:44:18 INFO tool.CodeGenTool: Beginning code generation  
...  
10/06/23 14:44:20 INFO mapred.JobClient: Running job: job_201006231439_0002  
10/06/23 14:44:21 INFO mapred.JobClient:  map 0% reduce 0%  
10/06/23 14:44:32 INFO mapred.JobClient:  map 100% reduce 0%  
10/06/23 14:44:34 INFO mapred.JobClient: Job complete:  
job_201006231439_0002  
...  
10/06/23 14:44:34 INFO mapreduce.ImportJobBase: Retrieved 3 records.
```

Hadoop – The Definitive Guide

Chapters 13, 14 & 15: HBase, ZooKeeper, and Sqoop

A Sqoop Example – 4

We can inspect this file's contents like so:

```
% hadoop fs -cat widgets/part-m-00000  
1,sprocket,0.25,2010-02-10,1,Connects two gizmos  
2,gizmo,4.00,2009-11-30,4,null  
3,gadget,99.99,1983-08-13,13,Our flagship product
```
